# Question 1

---

**Question Type:** MultipleChoice

---

Which are valid hardware model lifecycle phases?

Choose 3 answers

## Options:

---

- A- End of Subscription
- B- General Availability
- C- Upgrade
- D- End of Life
- E- Pre-release
- F- Beta

## Answer:

---

B, D, E

## **Explanation:**

---

According to the ServiceNow Hardware Asset Management documentation, hardware model lifecycle phases are the stages that a hardware model goes through from its introduction to the market to its retirement. The valid hardware model lifecycle phases are:

- \* Pre-release: The hardware model is not yet available for purchase, but it is planned to be released in the future.
- \* General Availability: The hardware model is available for purchase and supported by the manufacturer.
- \* End of Life: The hardware model is no longer available for purchase or supported by the manufacturer.
- \* Disposal: The hardware model is disposed of or recycled.

## **Question 2**

---

**Question Type:** MultipleChoice

---

What prevents two asset managers from transferring the same asset at the same time?

**Options:**

---

**A-** A stockroom rule

**B-** A business rule

**C-** A stock rule

**D-** A transfer rule

**Answer:**

---

B

**Explanation:**

---

According to the ServiceNow Hardware Asset Management documentation, a business rule is a server-side script that runs when a record is displayed, inserted, updated, or deleted, or when a table is queried. Business rules can be used to enforce data consistency and integrity, such as preventing duplicate transfers of the same asset. The other options are not valid terms in ServiceNow Hardware Asset Management.

## Question 3

---

**Question Type:** MultipleChoice

---

What is the focus of asset management?

### **Options:**

---

- A-** Financial tracking of the organization's network
- B-** Financial tracking of an organization's property
- C-** Building of the organization's property
- D-** Building the elements that create the organization's network

### **Answer:**

---

B

### **Explanation:**

---

According to the ServiceNow Hardware Asset Management documentation, asset management is the practice of managing the lifecycle and optimization of physical assets to meet the needs and goals of an organization. Asset management involves the balancing of costs, opportunities and risks against the desired performance of assets to achieve an organization's objectives. The other options are not the focus of asset management.

## **Question 4**

---

**Question Type: MultipleChoice**

---

What are the five valid phases of the Now Create methodology?

**Options:**

---

**A-** Create, recap, execute, deliver, review

**B-** Initiate, plan, execute, review, close

**C-** Review, prepare, create, validate, recap

**D-** Initiate, plan, execute, deliver, close

**Answer:**

---

D

**Explanation:**

---

According to the Now Create ebook, the Now Create methodology consists of five phases: initiate, plan, execute, deliver, and close. Each phase has a specific purpose, outcome, and set of tasks that guide the project team to successful delivery. The other options are not valid phases of the Now Create methodology.

## Question 5

---

**Question Type:** MultipleChoice

---

Delegated Developers are granted access only to what in which they are working?

### Options:

---

- A- Interfaces
- B- APIs
- C- Instances
- D- Scopes

### Answer:

---

D

### Explanation:

---

Delegated Developers are granted access only to scopes in which they are working<sup>1</sup>. A scope is a set of application files and data that are isolated from other applications on the same instance<sup>2</sup>.

Scopes allow developers to create and modify applications without affecting the functionality or security of other applications or the platform<sup>2</sup>.

Delegated Developers can be assigned developer permissions for specific scopes by an application administrator or a system administrator<sup>1</sup>. These permissions determine what types of files and data they can access and modify within the scope<sup>1</sup>.

Delegated Developers can also request cross-scope access to access resources from another scope, which must be approved or denied by the owner of the target scope<sup>1</sup>.

Delegated Developers do not have access to interfaces, APIs, or instances, unless they are explicitly granted by an administrator or a cross-scope request<sup>1</sup>. Reference:

1: Delegated Development - Product Documentation: San Diego - ServiceNow

2: Application Scoping - Product Documentation: San Diego - ServiceNow

## Question 6

---

**Question Type: MultipleChoice**

---

What three areas of data quality does the CMDB Health Dashboard focus on? (Choose three.)

### Options:

---

- A- Correctness
- B- Completeness
- C- Configuration
- D- Conciseness
- E- Conformity
- F- Compliance

### Answer:

---

A, B, F

### Explanation:

---

The CMDB Health Dashboard is a tool that monitors and reports the health of the Configuration Management Database (CMDB) data based on four key performance indicators (KPIs): completeness, compliance, correctness, and relationship accuracy<sup>12</sup>.

Completeness measures the percentage of configuration items (CIs) that have the required and recommended attributes populated<sup>12</sup>.

Compliance measures the percentage of CIs that adhere to predefined regulatory requirements, internal governance, and certificates<sup>12</sup>.

Correctness measures the percentage of CIs that pass the predefined data integrity rules, such as identification rules, orphan CI rules, and stale CI rules<sup>12</sup>.

Relationship accuracy measures the percentage of CIs that have the expected relationships with other CIs<sup>12</sup>.

The CMDB Health Dashboard focuses on the first three areas of data quality: completeness, compliance, and correctness<sup>12</sup>. These areas are also reflected in the overall CMDB health score, which is calculated as the weighted average of the three KPIs<sup>12</sup>.

The other options, configuration, conciseness, and conformity, are not the areas of data quality that the CMDB Health Dashboard focuses on<sup>12</sup>.

Configuration is the process of defining and managing the characteristics of CIs, such as their attributes, relationships, dependencies, and status<sup>3</sup>.

Conciseness is the quality of being clear and brief, without unnecessary words or details<sup>4</sup>.

Conformity is the quality of being consistent with a set of rules, standards, or expectations<sup>5</sup>.

## Question 7

---

**Question Type:** MultipleChoice

---

What is the preferred method of parsing in the Transform/Compose step of an event rule?

**Options:**

---

- A- Python
- B- Regex
- C- sed/awk
- D- JavaScript

**Answer:**

---

B

**Explanation:**

---

Once a catalog item has been requested, the mechanism that determines the approvals and tasks that are triggered in the application is the flow<sup>12</sup>.

A flow is a graphical representation of a business process that consists of one or more actions, such as approvals, tasks, notifications, scripts, etc., that are executed based on certain conditions and triggers<sup>12</sup>.

A flow can be associated with a catalog item to define the fulfillment process for that item, such as who needs to approve it, what tasks need to be performed, and what notifications need to be sent<sup>12</sup>.

A flow can be created and managed using the Flow Designer, a low-code development tool that allows users to design and test flows without writing any code<sup>12</sup>.

A flow can be activated or deactivated, versioned, and published to make it available for use<sup>12</sup>.

A flow can be monitored and debugged using the Flow Execution Details and the Flow Logs<sup>12</sup>.Reference:

Flow Designer
