# Question 1

---

**Question Type:** MultipleChoice

---

## SIMULATION

Physical connectivity is implemented between the two Layer 2 switches, and the network connectivity between them must be configured.

1. Configure an LACP EtherChannel and number it as 44; configure it between switches SW1 and SW2 using interfaces Ethernet0/0 and Ethernet0/1 on both sides. The LACP mode must match on both ends.

2. Configure the EtherChannel as a trunk link.

3. Configure the trunk link with 802.1q tags.

4. Configure VLAN 'MONITORING' as the untagged VLAN of the EtherChannel.

=====

Guidelines

This is a lab item in which tasks will be performed on virtual devices.

- \* Refer to the Tasks tab to view the tasks for this lab item.
- \* Refer to the Topology tab to access the device console(s) and perform the tasks.
- \* Console access is available for all required devices by clicking the device icon or using the tab(s) above the console window.
- \* All necessary preconfigurations have been applied.
- \* Do not change the enable password or hostname for any device.
- \* Save your configurations to NVRAM before moving to the next item.
- \* Click Next at the bottom of the screen to submit this lab and move to the next question.
- \* When Next is clicked, the lab closes and cannot be reopened.

**Options:**

---

**A-** Solution is given below explanation

## **Answer:**

---

A

## **Explanation:**

---

To configure an LACP EtherChannel and number it as 44, configure it between switches SW1 and SW2 using interfaces Ethernet0/0 and Ethernet0/1 on both sides, configure the EtherChannel as a trunk link, configure the trunk link with 802.1q tags, and configure VLAN 'MONITORING' as the untagged VLAN of the EtherChannel, you need to follow these steps:

On both SW1 and SW2, enter the global configuration mode by using the configure terminal command.

On both SW1 and SW2, select the two interfaces that will form the EtherChannel by using the interface range ethernet 0/0 - 1 command. This will enter the interface range configuration mode.

On both SW1 and SW2, set the protocol to LACP by using the channel-protocol lacp command.

On both SW1 and SW2, assign the interfaces to an EtherChannel group number 44 by using the channel-group 44 mode active command. This will create a logical interface named Port-channel44 and set the LACP mode to active on both ends. The LACP mode must match on both ends for the EtherChannel to form.

On both SW1 and SW2, exit the interface range configuration mode by using the exit command.

On both SW1 and SW2, enter the Port-channel interface configuration mode by using the interface port-channel 44 command.

On both SW1 and SW2, configure the Port-channel interface as a trunk link by using the switchport mode trunk command.

On both SW1 and SW2, configure the Port-channel interface to use 802.1q tags for VLAN identification by using the switchport trunk encapsulation dot1q command.

On both SW1 and SW2, configure VLAN 'MONITORING' as the untagged VLAN of the Port-channel interface by using the switchport trunk native vlan MONITORING command.

On both SW1 and SW2, exit the Port-channel interface configuration mode by using the exit command.

On both SW1 and SW2, save the configuration to NVRAM by using the copy running-config startup-config command.

## Question 2

---

**Question Type: MultipleChoice**

---

### SIMULATION

All physical cabling is in place. Router R4 and PCI are fully configured and inaccessible. R4's WAN interfaces use .4 in the last octet for each subnet.

Configurations should ensure that connectivity is established end-to-end.

1 . Configure static routing to ensure R1 prefers the path through R2 to reach only PCI on R4's LAN

2. Configure static routing that ensures traffic sourced from R1 will take an alternate path through R3 to PCI in the event of an outage along the primary path
3. Configure default routes on R1 and R3 to the Internet using the least number of hops

#### Guidelines

This is a lab item in which tasks will be performed on virtual devices.

- \* Refer to the Tasks tab to view the tasks for this lab item.
- \* Refer to the Topology tab to access the device console(s) and perform the tasks.
- \* Console access is available for all required devices by clicking the device icon or using the tab(s) above the console window.
- \* All necessary preconfigurations have been applied.
- \* Do not change the enable password or hostname for any device.
- \* Save your configurations to NVRAM before moving to the next item.
- \* Click Next at the bottom of the screen to submit this lab and move to the next question.
- \* When Next is clicked, the lab closes and cannot be reopened.

Device	Interface	IP Address
R3	e0/2	209.165.201.3
ISP	e0/0	209.165.201.1
PC1	e0/0	10.0.41.10

## Options:

---

A- See the solution below in Explanation

## Answer:

---

A

## Explanation:

---

To configure static routing on R1 to ensure that it prefers the path through R2 to reach only PC1 on R4's LAN, you need to create a static route for the host 10.0.0.100/8 with a next-hop address of 20.0.0.2, which is the IP address of R2's interface connected to R1. You also need to assign a lower administrative distance (AD) to this route than the default AD of 1 for static routes, so that it has a higher preference over other possible routes. For example, you can use an AD of 10 for this route. To create this static route, you need to enter the following commands on R1's console:

```
R1#configure terminal R1(config)#ip route 10.0.0.100 255.0.0.0 20.0.0.2 10 R1(config)#end
```

To configure static routing on R1 that ensures that traffic sourced from R1 will take an alternate path through R3 to PC1 in the event of an outage along the primary path, you need to create another static route for the host 10.0.0.100/8 with a next-hop address of 40.0.0.2, which is the IP address of R3's interface connected to R1. You also need to assign a higher AD to this route than the AD of the primary route, so that it has a lower preference and acts as a backup route. For example, you can use an AD of 20 for this route. This type of static route is also known as a floating static route. To create this static route, you need to enter the following commands on R1's console:

```
R1#configure terminal R1(config)#ip route 10.0.0.100 255.0.0.0 40.0.0.2 20 R1(config)#end
```

To configure default routes on R1 and R3 to the Internet using the least number of hops, you need to create a static route for the network 0.0.0.0/0 with a next-hop address of the ISP's interface connected to each router respectively. A default route is a special type of static route that matches any destination address and is used when no other specific route is available. The ISP's interface connected to R1 has an IP address of 10.0.0.4, and the ISP's interface connected to R3 has an IP address of 50.0.0.4. To create these default routes, you need to enter the following commands on each router's console:

```
On R1: R1#configure terminal R1(config)#ip route 0.0.0.0 0.0.0.0 10.0.0.4 R1(config)#end
```

```
On R3: R3#configure terminal R3(config)#ip route 0.0.0.0 0.0.0.0 50.0.0.4 R3(config)#end
```

## Question 3

---

**Question Type:** MultipleChoice

---

SIMULATION

All physical cabling is in place. A company plans to deploy 32 new sites.

The sites will utilize both IPv4 and IPv6 networks.

1 . Subnet 172.25.0.0/16 to meet the subnet requirements and maximize

the number of hosts

Using the second subnet

- \* Assign the first usable IP address to e0/0 on Sw101

- \* Assign the last usable IP address to e0/0 on Sw102

2. Subnet to meet the subnet requirements and maximize

the number of hosts

c Using the second subnet

- \* Assign an IPv6 GUA using a unique 64-Bit interface identifier

on e0/0 on Sw101

- \* Assign an IPv6 GUA using a unique 64-Bit interface identifier

on e0/0 on swi02

Guidelines

This is a lab item in which tasks will be performed on virtual devices.

- \* Refer to the Tasks tab to view the tasks for this lab item.

- \* Refer to the Topology tab to access the device console(s) and perform the tasks.

- \* Console access is available for all required devices by clicking the device icon or using the tab(s) above the console window.
- \* All necessary preconfigurations have been applied.
- \* Do not change the enable password or hostname for any device.
- \* Save your configurations to NVRAM before moving to the next item.
- \* Click Next at the bottom of the screen to submit this lab and move to the next question.
- \* When Next is clicked, the lab closes and cannot be reopened.

## Options:

---

A- See the Explanation for the solution

## Answer:

---

A

## Explanation:

---

To subnet 172.25.0.0/16 to meet the subnet requirements and maximize the number of hosts, you need to determine how many bits you need to borrow from the host portion of the address to create enough subnets for 32 sites. Since 32 is  $2^5$ , you need to borrow 5 bits, which means your new subnet mask will be /21 or 255.255.248.0. To find the second subnet, you need to add the value of the fifth bit (32) to the third octet of the network address (0), which gives you 172.25.32.0/21 as the second subnet. The first usable IP address in this subnet is 172.25.32.1, and the last usable IP address is 172.25.39.254.

To assign the first usable IP address to e0/0 on Sw101, you need to enter the following commands on the device console:

```
Sw101#configure terminal Sw101(config)#interface e0/0 Sw101(config-if)#ip address 172.25.32.1 255.255.248.0 Sw101(config-if)#no shutdown Sw101(config-if)#end
```

To assign the last usable IP address to e0/0 on Sw102, you need to enter the following commands on the device console:

```
Sw102#configure terminal Sw102(config)#interface e0/0 Sw102(config-if)#ip address 172.25.39.254 255.255.248.0 Sw102(config-if)#no shutdown Sw102(config-if)#end
```

To subnet an IPv6 GUA to meet the subnet requirements and maximize the number of hosts, you need to determine how many bits you need to borrow from the interface identifier portion of the address to create enough subnets for 32 sites. Since 32 is  $2^5$ , you need to borrow 5 bits, which means your new prefix length will be /69 or `ffff:fff:fff:fff8::/69` (assuming that your IPv6 GUA has a /64 prefix by default). To find the second subnet, you need to add the value of the fifth bit (32) to the fourth hextet of the network address (0000), which gives you `xxxx:xxxx:xxxx:0020::/69` as the second subnet (where `xxxx:xxxx:xxxx` is your IPv6 GUA prefix). The first and last IPv6 addresses in this subnet are `xxxx:xxxx:xxxx:0020::1` and `xxxx:xxxx:xxxx:0027:fff:fff:fff:ffe` respectively.

To assign an IPv6 GUA using a unique 64-bit interface identifier on e0/0 on Sw101, you need to enter the following commands on the device console (assuming that your IPv6 GUA prefix is `2001:db8::/64`):

```
Sw101#configure terminal Sw101(config)#interface e0/0 Sw101(config-if)#ipv6 address 2001:db8::20::1/69 Sw101(config-if)#no shutdown Sw101(config-if)#end
```

To assign an IPv6 GUA using a unique 64-bit interface identifier on e0/0 on Sw102, you need to enter the following commands on the device console (assuming that your IPv6 GUA prefix is `2001:db8::/64`):

```
Sw102#configure terminal Sw102(config)#interface e0/0 Sw102(config-if)#ipv6 address 2001:db8::27::ffe/69 Sw102(config-if)#no shutdown Sw102(config-if)#end
```

## Question 4

---

**Question Type:** MultipleChoice

---

## SIMULATION

Guidelines   Topology   Tasks

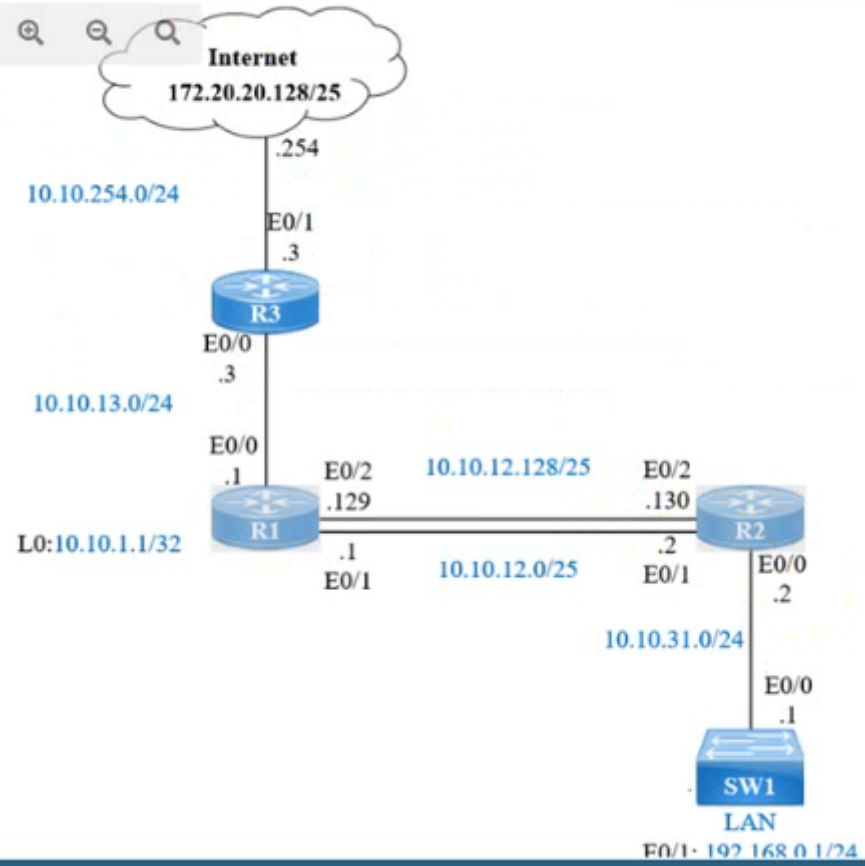

### Guidelines

This is a lab item in which tasks will be performed on virtual devices.

- Refer to the **Tasks** tab to view the tasks for this lab item.
- Refer to the **Topology** tab to access the device console(s) and perform the tasks.
- Console access is available for all required devices by clicking the device icon or using the tab(s) above the console window.
- All necessary preconfigurations have been applied.
- Do not change the enable password or hostname for any device.
- **Save your configurations** to NVRAM before moving to the next item.
- Click **Next** at the bottom of the screen to submit this lab and move to the next question.
- When **Next** is clicked, the lab closes and cannot be reopened.

The diagram illustrates a network topology with the following components and connections:

- R1:** Connected to R2 via E0/2 interfaces. IP address on E0/2 is 10.10.12.129. E0/0 interface has IP 10.10.1.1/32.
- R2:** Connected to R1 via E0/2 interfaces. IP address on E0/2 is 10.10.12.130. E0/0 interface has IP 10.10.31.2.
- SW1:** Connected to R2 via E0/0 interface. IP address on E0/0 is 10.10.31.1. LAN is 192.168.0.1/24.

IP connectivity and OSPF are preconfigured on all devices where necessary. Do not make any changes to the IP addressing or OSPF. The company policy uses connected interfaces and next hops when configuring static routes except for load balancing or redundancy without floating static. Connectivity must be established between subnet `172.20.20.128/25` on the Internet and the LAN at `192.168.0.0/24` connected to SW1:

1. Configure reachability to the switch SW1 LAN subnet in router R2.
2. Configure default reachability to the Internet subnet in router R1.
3. Configure a single static route in router R2 to reach to the Internet subnet considering both redundant links between routers R1 and R2. A default route is NOT allowed in router R2.
4. Configure a static route in router R1 toward the switch SW1 LAN subnet where the primary link must be through Ethernet0/1. and the backup link must be through Ethernet0/2 using a floating route. Use the minimal administrative distance value when required.

### Options:

---

A- See the Explanation below

### Answer:

---

A

### Explanation:

---

Answer as below configuration:

On R2:

Enable

Conf t

Ip route 192.168.1.0 255.255.255.0 10.10.31.1

On R1:

Enable

Conf t

Ip route 0.0.0.0 0.0.0.0 10.10.13.3

On R2

Ip route 172.20.20.128 255.255.255.128 e0/2

Ip route 172.20.20.128 255.255.255.128 e0/1

On R1

Ip route 192.168.0.0 255.255.255.0 e0/1

Ip route 192.168.0.0 255.255.255.0 10.10.12.2 3

Save all configurations after every router from anyone of these command

Do wr

Or

Copy run start

## Question 5

**Question Type:** MultipleChoice

---

SIMULATION

Guidelines

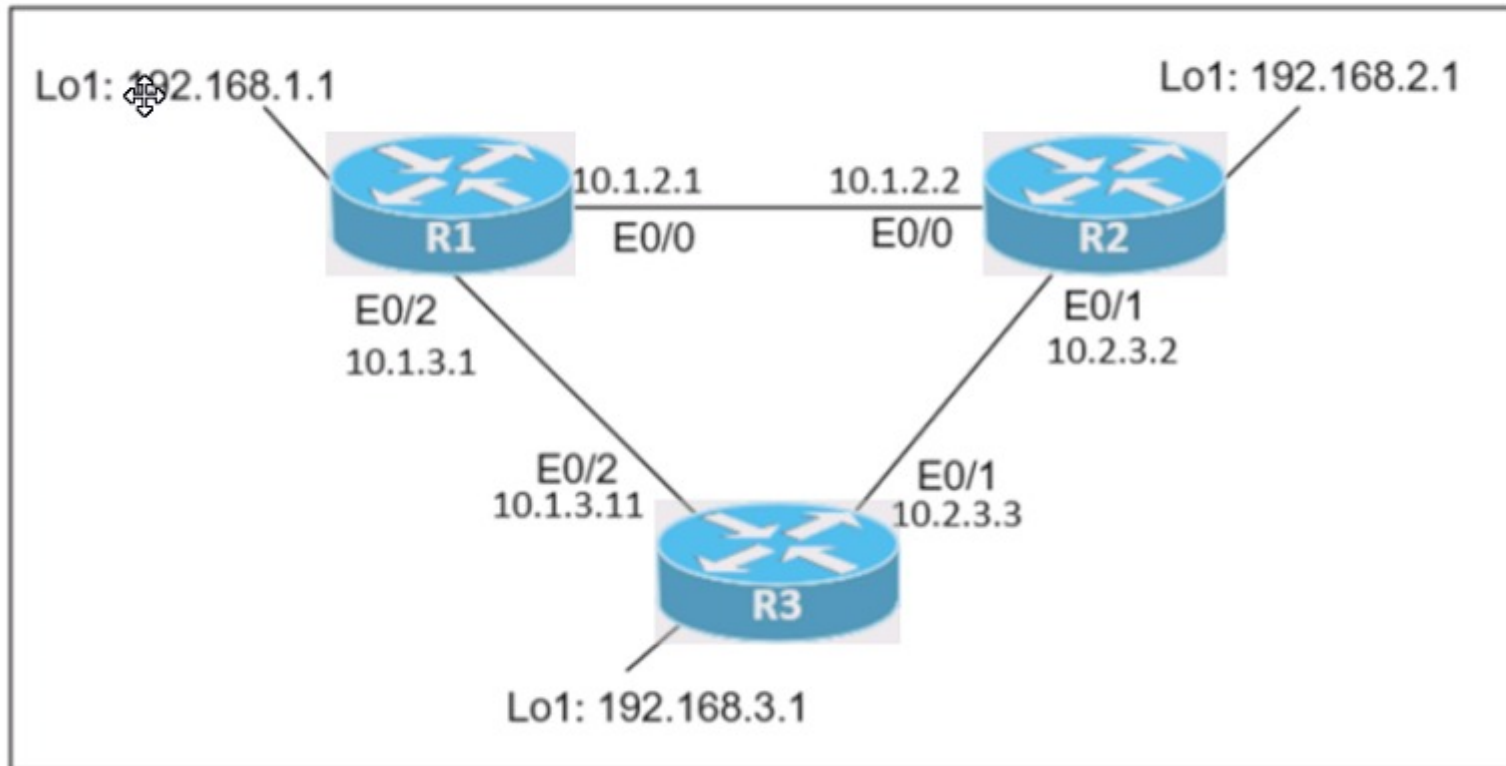

Topology

Tasks

R1

R2

R3

R1#

The screenshot shows a web-based lab interface. At the top, there are three tabs: 'Guidelines' (which is selected and underlined), 'Topology', and 'Tasks'. To the right of these tabs are three device icons labeled 'R1', 'R2', and 'R3'. Below the 'Guidelines' tab, the heading 'Guidelines' is displayed. A mouse cursor is positioned over the 'Guidelines' text. Below the heading, a paragraph states: 'This is a lab item in which tasks will be performed on virtual devices.' This is followed by a bulleted list of instructions. On the right side of the interface, a terminal window for device 'R1' is visible, showing a prompt 'R1#' and a cursor.

Guidelines

This is a lab item in which tasks will be performed on virtual devices.

- Refer to the **Tasks** tab to view the tasks for this lab item.
- Refer to the **Topology** tab to access the device console(s) and perform the tasks.
- Console access is available for all required devices by clicking the device icon or using the tab(s) above the console window.
- All necessary preconfigurations have been applied.
- Do not change the enable password or hostname for any device.
- **Save your configurations** to NVRAM before moving to the next item.
- Click **Next** at the bottom of the screen to submit this lab and move to the next question.
- When **Next** is clicked, the lab closes and cannot be reopened.

R1#

Connectivity between three routers has been established, and IP services must be configured in the order presented to complete the implementation. Tasks assigned include configuration of NAT, NTP, DHCP, and SSH services.

1. All traffic sent from R3 to the R1 Loopback address must be configured for NAT on R2. All source addresses must be translated from R3 to the IP address of Ethernet0/0 on R2, while using only a standard access list named NAT To verify, a ping must be successful to the R1 Loopback address sourced from R3. Do not use NVI NAT configuration.
2. Configure R1 as an NTP server and R2 as a client, not as a peer, using the IP address of the R1 Ethernet0/2 interface. Set the clock on the NTP server for midnight on January 1, 2019.
3. Configure R1 as a DHCP server for the network 10.1.3.0/24 in a pool named TEST. Using a single command, exclude addresses 1-10 from the range. Interface Ethernet0/2 on R3 must be issued the IP address of 10.1.3.11 via DHCP.
4. Configure SSH connectivity from R1 to R3, while excluding access via other remote connection protocols. Access for user root and password Cisco must be set on router R3 using RSA and 1024 bits. Verify connectivity using an SSH session from router R1 using a destination address of 10.1.3.11. Do NOT modify console access or line numbers to accomplish this task.

### Options:

---

---

SIMULATION

### Guidelines

---

This is a lab item in which tasks will be performed on virtual devices.

- Refer to the **Tasks** tab to view the tasks for this lab item.
- Refer to the **Topology** tab to access the device console(s) and perform the tasks.
- Console access is available for all required devices by clicking the device icon or using the tab(s) above the console window.
- All necessary preconfigurations have been applied.
- Do not change the enable password or hostname for any device.
- **Save your configurations** to NVRAM before moving to the next item.
- Click **Next** at the bottom of the screen to submit this lab and move to the next question.
- When **Next** is clicked, the lab closes and cannot be reopened.

N

Three switches must be configured for Layer 2 connectivity. The company requires only the designated VLANs to be configured on their respective switches and permitted across any links between switches for security purposes. Do not modify or delete VTP configurations.

The network needs two user-defined VLANs configured:

VLAN 110: MARKETING

VLAN 210: FINANCE

1. Configure the VLANs on the designated switches and assign them as access ports to the interfaces connected to the PCs.
2. Configure the e0/2 interfaces on Sw1 and Sw2 as 802.1q trunks with only the required VLANs permitted.
3. Configure the e0/3 interfaces on Sw2 and Sw3 as 802.1q trunks with only the required VLANs permitted.

## Question 8

---

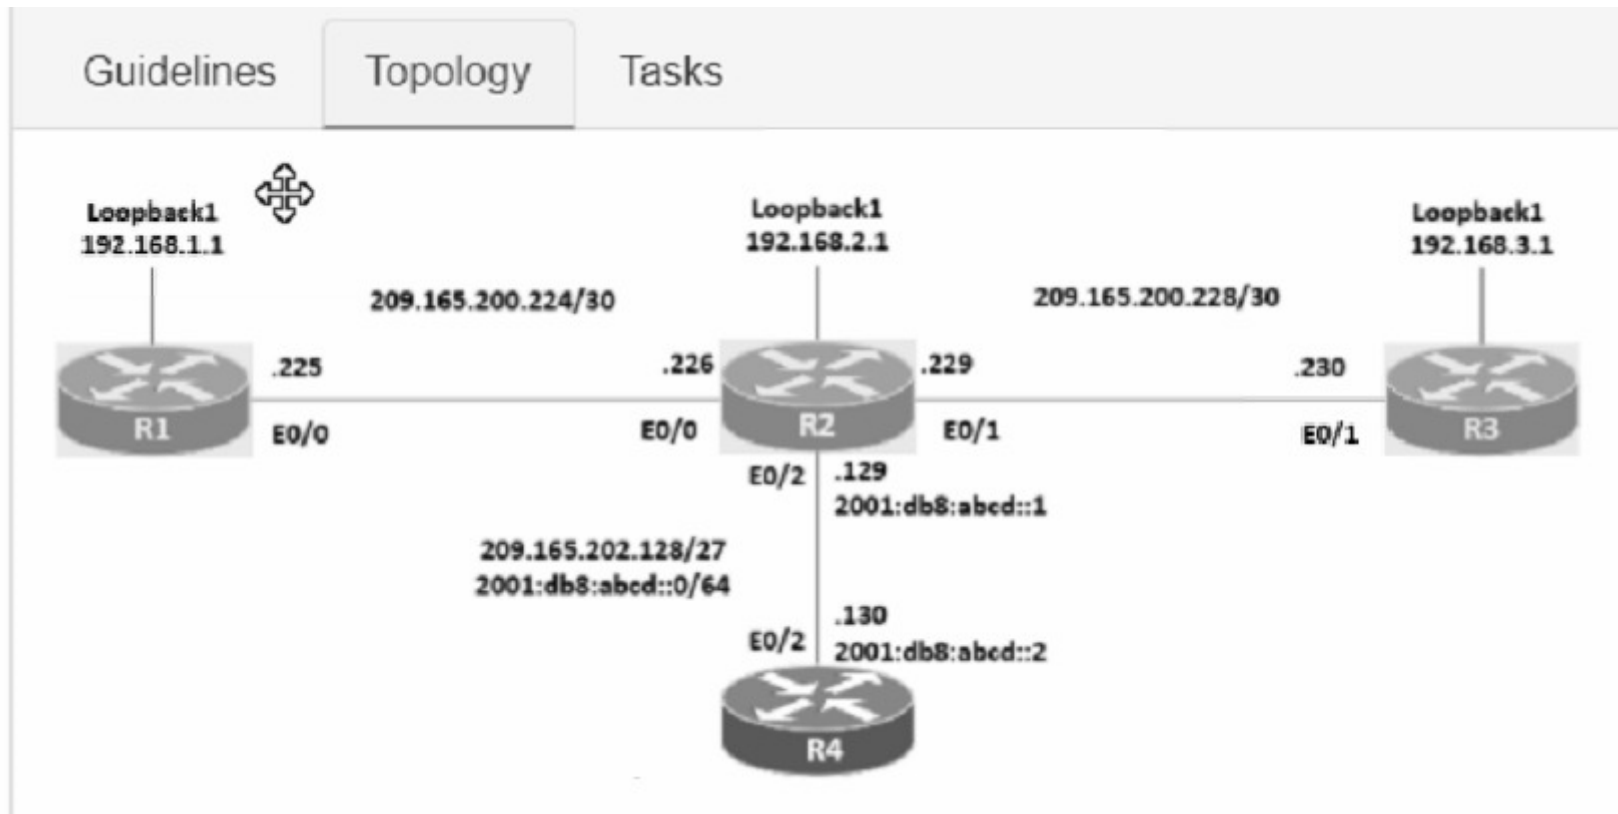

**Question Type: MultipleChoice**

---

### SIMULATION

Connectivity between four routers has been established. IP connectivity must be configured in the order presented to complete the implementation. No dynamic routing protocols are included.

1. Configure static routing using host routes to establish connectivity from router R3 to the router R1 Loopback address using the source IP of 209.165.200.230.
2. Configure an IPv4 default route on router R2 destined for router R4.
3. Configure an IPv6 default router on router R2 destined for router R4.

**Options:**

A- See the Explanation below

**Answer:**

A

### **Explanation:**

---

Answer as below configuration:

1.- on R3

config terminal

```
ip route 192.168.1.1 255.255.255.255 209.165.200.229
```

end

copy running start

2.- on R2

config terminal

```
ip route 0.0.0.0 0.0.0.0 209.165.202.130
```

end

copy running start

3.- on R2

config terminal

```
ipv6 route ::/0 2001:db8:abcd::2
```

```
end
```

```
copy running start
```
