Question 1

Question Type: MultipleChoice

A solutions consultant needs to configure the enhanced connector for a customer. The customer has asked the solutions consultant to make sure that changes to metadata in Experience Manager will be synced back to Workfront on linked Workfront documents. Two of the fields that the customer wants synced are Content Type and Effort They are defined in workfront and Experience Manager as the following:

Document custom form fields in Workfront:

Label: Content Type
Name: contentType
Choices: (1) Contract, (2) Financials, (3) Image, (4) Requirements, (5) RFP, (6) Scope
Display Type: Dropdown (only one selection is allowed)

Label: Effort
Name: effort
Field Type: Calculated Field
Calculation: Project.Planned Hours/60

Properties defined in Experience Manager:
Content Type -> ./jcr:content/metadata/content-type
Effort -> ./jcr:content/metadata/effort

To accomplish this work, the solutions consultant configures a workflow model. The workflow model has a single step, 'Workfront-Map Property'.

What Property Assignments will make sure changes in Experience Manager are reflected in Workfront?

A)

```
CUSTOM FORMS:contentType=../jcr:content/metadata/content-type  
CUSTOM FORMS:effort=../jcr:content/metadata/effort
```

B)

```
DE:Content Type=../jcr:content/metadata/content-type  
DE:Effort=../jcr:content/metadata/effort
```

C)

```
DE:contentType=../jcr:content/metadata/content-type  
DE:effort=../jcr:content/metadata/effort
```

Options:

A- Option A

B- Option B

C- Option C

Answer:

A

Explanation:

To ensure that changes in metadata in Adobe Experience Manager (AEM) are synced back to Workfront for the fields Content Type and Effort, the correct property assignment should map the Workfront custom form fields to the corresponding paths in the AEM JCR repository.

In Option A:

CUSTOM FORMS

is mapped to /jcr:content/metadata/content-type

CUSTOM FORMS

is mapped to /jcr:content/metadata/effort

This configuration ensures that changes made in AEM's content-type and effort metadata properties will be reflected in the respective custom fields in Workfront.

Options B and C use incorrect prefixes (e.g., 'DE:') and would not map the properties correctly for synchronization between Workfront and AEM.

Refer to the Workfront Enhanced Connector documentation for detailed instructions on configuring metadata synchronization between AEM and Workfront.

Question 2

Question Type: MultipleChoice

An implementation consultant wants to configure the enhanced connector inside a customer's Adobe experience Manager environment. The customer has expressed interest in automatically publishing assets when they are sent from Adobe Workfront to Adobe Experience Manager. The customer does not have an instance of Brand Portal running.

The customer has a project custom form field with the following details:

Label: Automatically Publish Assets?
Name: auto_publish_assets
Choices: (1) Yes, (2) No
Display Type: Radio Buttons

The customer wants this automatic publishing to be conditional on the value of the project custom form field being equal to, Yes.

Which option should be used to implement this feature?

Options:

- A-** Check the option, 'Automatically publish assets when sent from Workfront' in the advanced tab of the configuration properties. In the Custom form field dropdown select, 'CUSTOM FORM auto_publish_asset', and in the Custom form field value text box, write 'Yes'.
- B-** Check the option, 'Automatically publish assets when sent from Workflow' in the advanced tab of the configuration properties in the Custom form field dropdown select, 'CUSTOM FORMS Automatically Publish Assets', and in the Custom form field value text box, write 'Yes'.
- C-** Check the option, 'Publish all perfect assets to Brand Portal upon project completion.' In the advanced tab of the configuration properties in the Custom form field dropdown select, 'CUSTOM FORMS auto_publish_assets', and in the Custom form field value text box, write 'Yes'.

Answer:

A

Explanation:

To implement conditional automatic publishing of assets from Workfront to AEM based on the value of the custom form field, you should:

Check the option 'Automatically publish assets when sent from Workfront': This ensures that the assets will be automatically published to AEM when they are sent from Workfront.

Use the custom form field ('auto_publish_assets'): The system needs to check the value of this custom form field, and if it is set to 'Yes', the assets will be automatically published.

Set the Custom Form Field Value to 'Yes': In the configuration, you'll specify that automatic publishing only occurs when the field value is 'Yes.'

Option B incorrectly refers to 'Workflow' instead of 'Workfront,' and Option C refers to publishing to Brand Portal, which is irrelevant since the customer does not have Brand Portal.

Refer to Workfront for AEM Enhanced Connector documentation for step-by-step guidance on configuring conditional automatic asset publishing.

Question 3

Question Type: MultipleChoice

A solutions consultant is configuring the Workfront for Experience Manager enhanced connector for a customer the customer needs to be able to version files inside of Adobe Experience Manager when uploading new versions inside of Adobe workfront. The solutions consultant has ensured the option to 'Store assets with the same name as versions of the existing asset' has been checked in the Advanced tab of the enhanced connector configuration.

Which two criteria are required to make sure the file is versioned correctly in Experience Manager? (Choose two.)

Options:

- A-** The new version must have the same name as the current version
- B-** The new version must have a version number appended to the file name (!.e., asset name-1.pdf).
- C-** The new version must have the same metadata compared to the current version
- D-** The new version must be sent from Workfront to the same location as the current version.

Answer:

A, D

Explanation:

When configuring the Workfront for Experience Manager Enhanced Connector to version files correctly in AEM, the following criteria must be met:

Same Name: The new version of the file must have the exact same name as the current version. This ensures that AEM recognizes the file as a new version of an existing asset rather than a completely new asset.

Same Location: The new version must be sent to the same location in AEM as the current version. If the file is uploaded to a different location, AEM will not recognize it as a version of the existing asset.

Option B (appending version numbers) is not required for versioning in AEM, as versioning is handled internally based on the file's name and location. Option C (same metadata) is not necessary for versioning but could be relevant for other workflows or metadata synchronization.

Refer to AEM Enhanced Connector documentation for detailed instructions on configuring versioning and asset management between Workfront and AEM.

Question 4

Question Type: MultipleChoice

An implementation consultant is configuring the enhanced connector Project Linked holders feature for a customer. The customer wants the linked folder structure to be defined using the workfront Portfolio name. Workfront Program name. Workfront Project name, and the project type. The project type is a project custom form field defined by the following:

Label: Project Type

Name: projectType

Choices: (1) Campaign, (2) Product Launch, (3) Sponsorship, (4) Other

What Linked Folder Structure defines this correctly?

Options:

A- Portfolio,Program,Name.DE:projectType

B- Portfolio,Program,Name,projectType

C- Portfolio,Program,project,Program, project Type

Answer:

B

Explanation:

In this case, the customer wants to define the linked folder structure based on the Workfront Portfolio name, Program name, Project name, and Project Type. The Project Type is a custom form field with specific choices like 'Campaign,' 'Product Launch,' etc.

The correct format to define the folder structure in AEM based on these elements would be:

Portfolio, Program, Name, projectType: This structure will create a hierarchical folder system in AEM where the folders are nested by Portfolio, Program, Project Name, and Project Type (which is pulled from the custom form field).

Option A includes an incorrect syntax with 'DE

,' which is not necessary, and Option C repeats the 'Program' and misorders the fields.

Refer to Workfront Enhanced Connector documentation for further guidance on defining folder structures using custom form fields.

Question 5

Question Type: MultipleChoice

An implementation consultant needs to configure metadata mapping between Adobe Workfront custom form fields and Adobe Experience Manager metadata properties. Which two types of custom forms can the implementation consultant use to define these mappings? (Choose two)

Options:

A- Issue

B- Document

C- Portfolio

D- Program

Answer:

A, B

Explanation:

When configuring metadata mapping between Adobe Workfront custom form fields and Adobe Experience Manager metadata properties, you can use Issue and Document custom forms to define these mappings. These types of forms are commonly used for tracking and managing work items and documents, both of which need to have their metadata synchronized between the two systems.

Issue custom forms: Used for tracking work requests, such as issues or tasks.

Document custom forms: Specifically used for managing metadata related to documents, which can be mapped directly to AEM assets.

Options C (Portfolio) and D (Program) are not typically used for metadata mapping related to assets or documents.

Refer to Workfront Enhanced Connector documentation for more information on mapping custom forms to AEM metadata properties.

Question 6

Question Type: MultipleChoice

An implementation consultant wants to configure the enhanced connector inside a customer's Adobe Experience Manager environment. The customer needs to sync comments on linked documents from Adobe Workfront to Adobe Experience Manager.

how should this request be implemented?

Options:

- A-** Select the Advanced tab Inside the enhanced connector configuration properties, and click Enable Comment Sync.
- B-** Select the Event Subscriptions tab inside the enhanced connector configuration properties, and click Enable Workfront Event Subscriptions
- C-** Select the Event Subscriptions tab inside the enhanced connector configuration properties, and click Unable Comment Sync.

Answer:

B

Explanation:

To synchronize comments on linked documents from Adobe Workfront to Adobe Experience Manager, you need to enable Workfront Event Subscriptions in the enhanced connector configuration properties. Event Subscriptions allow AEM to track changes and updates from Workfront, including comment synchronization.

Workfront Event Subscriptions ensure that comments made in Workfront on linked documents are automatically synced to AEM.

Option A incorrectly references the Advanced tab, and Option C incorrectly states 'Unable' instead of 'Enable' Comment Sync.

Refer to AEM Enhanced Connector documentation on Event Subscriptions for step-by-step configuration.
